

# Vendor Access Review v2

Version: 2.0  
Status: Current  
Released: 2024-07-15

## Purpose

This updated review strengthens third-party access governance by requiring OAuth authentication, named owners, and documented quarterly reviews.

## Key Changes from v1

- API key-only vendor access is no longer allowed; OAuth 2.0 is mandatory.
- Every vendor must have a named business owner and a quarterly access-review date.
- High-risk vendors require Security approval before production access is renewed.

## Required Actions

Backend Engineering must migrate Atlas Logistics to OAuth. Security must approve high-risk access. Procurement must record owners and review dates for every vendor.
